

Characteristics:

General Description:

The single and dual channel DIN Rail Temperature Signal Converter D1072S and D1072D accepts a low level dc signal from millivolt, thermocouple or RTD temperature sensor, located in Hazardous Area, and converts, with isolation, the signal to drive a Safe Area load. Output signal can be direct or reverse.

Duplicator function provides two independent outputs for the single input. Adder, subtractor, low/high selector functions provides two independent outputs representing input A, input B, input A plus input B, input A minus input B, low/high selector.

Function:

1 or 2 channel I.S. input from mV, thermocouples, 3-4 wires resistance thermometers, transmitting potentiometers, provides 3 port isolation (input/output/supply) and current (source mode) or voltage output signal.

Duplicator, adder, subtractor, low/high selector function provided.

The programmable RTD line resistance compensation allows the use of 2 wires RTDs or error compensation for 3-4 wires RTDs. Reference junction compensation can be automatic, with option 91, or fixed by software setting.

Signalling LEDs:

Power supply indication (green), burnout (red).

Configurability:

Totally software configurable, no jumpers or switches, input sensor, connection mode, burnout operation, mA or V output signal, by GM Pocket Portable Configurator PPC1090, powered by the unit or configured by PC via RS-232 serial line with

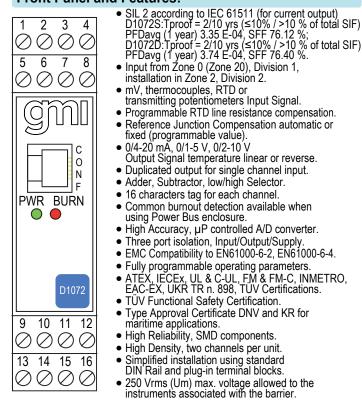

PPC1092 Adapter and SWC1090 Configurator software.

A 16 characters tag can be inserted using SWC1090 Configurator software. To operate PPC1090 or PPC1092 refer to instruction manual.

EMC:

Fully compliant with CE marking applicable requirements.

Front Panel and Features:

Ref. Junction Compensator (TC input) OPT1091

Operating parameters are programmable by the GM Pocket Portable Configurator PPC1090 or via RS-232 serial line with PPC1092 Adapter and SWC1090 Configurator software. If the parameters are provided with the purchasing order the unit will be configured accordingly, otherwise the unit will be supplied with default parameters. **NOTE:** for thermocouple sensor input, the Reference Junction Compensator is required for automatic ambient temperature compensation. It has to be ordered as OPT1091, it will be supplied separately and it has to be connected to the input terminal blocks as indicated in the function diagram.

SIL 2 Temperature Signal Converter, Duplicator, Adder/Subtractor DIN-Rail Models D1072S, D1072D

Technical Data:

Technical Data:
Supply: 12-24 Vdc nom (10 to 30 Vdc) reverse polarity protected,
ripple within voltage limits ≤ 5 Vpp.
Current consumption @ 24 V: 70 mA for 2 channels D1072D,
45 mA for 1 channel D1072S with 20 mA output typical.
Current consumption @ 12 V: 140 mA for 2 channels D1072D,
80 mA for 1 channel D1072S with 20 mA output typical.
Power dissipation: 1.5 W for 2 channels D1072D, 1.0 W for 1 channel D1072S with 24 V supply voltage and 20 mA output typical.
Max. power consumption: at 30 V supply voltage, overload condition and
PPC1090 connected, 2.1 W for 2 channels D1072D, 1.4 W for 1 channel D1072S.
Isolation (Test Voltage): I.S. In/Out 1.5 KV; I.S. In/Supply 1.5 KV; I.S. In/I.S. In 500 V;
Out/Supply 500 V; Out/Out 500 V.
Input: millivolt or thermocouple type A1, A2, A3, B, E, J, K, L, Lr, N, R, S, S1, T, U or
3-4 wires RTD Pt100, Pt200, Pt300 to DIN43760, Pt100 (0.3916), Ni100, Ni120 or
Pt500, Pt100, Pt50, Cu100, Cu53, Cu50, Cu46 (russian standard) or
3 wires transmitting potentiometer (50 Ω to 20 K Ω).
Integration time: 500 ms.
Resolution: 5 µV on mV or thermocouple, 1 µV thermocouple type B, R, S, S1,
2μ V thermocouple A1, A2, A3, 20 m Ω on RTD, 0.05 % on transmitting potentiometer.
Visualization: 0.1 °C on temperature, 10 µV on mV, 0.1 % on potentiometer.
Input range: within rated limits of sensor (-10 to + 80 mV).
Measuring RTD current: ≤ 0.5 mA.
RTD line resistance compensation: $\leq 10 \Omega$.
RTD line resistance error compensation: - 5 to + 20 Ω, programmable. Thermocouple Reference Junction Compensation: automatic, by external
sensor OPT1091 separately ordered, or fixed programmable from - 60 to + 100 °C. Thermocouple burnout current: < 30 nA.
Burnout: enabled or disabled. Analog output can be programmed to detect burnout
condition with downscale or highscale forcing.
Burnout condition signalled by red front panel LED.
Output: $0/4$ to 20 mA, on max. 600 Ω load source mode, current limited at 22 mA or
0/1 to 5 V or 0/2 to 10 V signal, limited at 11 V.
Resolution: 2 µA current output or 1 mV voltage output.
Transfer characteristic: linear or reverse on mV or transmitting potentiometer,
temperature linear or reverse on temperature sensors.
Response time: \leq 50 ms (10 to 90 % step change).
Output ripple: \leq 20 mVrms on 250 Ω load.
Performance: Ref. Conditions 24 V supply, 250 Ω load, 23 ± 1 °C ambient temperature.
Input:
Calibration and linearity accuracy: $\leq \pm 40 \mu$ V on mV or thermocouple,
200 m Ω on RTD, 0.2 % on potentiometer or ± 0.05 % of input value.
Temperature influence: $\leq \pm 2 \mu V$, 20 mΩ, 0.02 % or ± 0.01 % of input value for a 1 °C shapes
for a 1 °C change. Ref. Junction Compensation influence: ≤ ± 1 °C (thermocouple sensor).
Analog Output:
Analog Output: Calibration accuracy: < + 0.1 % of full scale
Calibration accuracy: $\leq \pm 0.1$ % of full scale.
Calibration accuracy: $\le \pm 0.1$ % of full scale. Linearity error: $\le \pm 0.05$ % of full scale.
Calibration accuracy: $\leq \pm 0.1$ % of full scale.
Calibration accuracy: $\le \pm 0.1$ % of full scale. Linearity error: $\le \pm 0.05$ % of full scale. Supply voltage influence: $\le \pm 0.05$ % of full scale for a min to max supply change.

🗆 0-10 V	voltage output range from 0 to 10 V		
Burnout: analog	g output burnout state		
None	burnout function is disabled;		
	analog output represents the input measure as configured		
Downscale	analog output is forced at mA Burnout or V Burnout lower value		
Upscale	analog output is forced at mA Burnout or V Burnout higher value		
Function: analog output function			
🗆 Ch. A	analog output represents input of first channel		
🗆 Ch. B	analog output represents input of second channel		
🗆 Add	analog output represents the sum of the two input channels: (A+B)/2		
🗆 Sub	analog output represents the difference of the two input channels: A-B		
🗀 High Ch	analog output represents the higher of the two input channels		
🗆 Low Ch	analog output represents the lower of the two input channels		
Output Limits: current or voltage analog output normal working range limits or			
burnout detection			
mA working: current analog output range in normal working condition.			
mA Burnout: current analog output lower and higher value for burnout signalation.			
V working: voltage analog output range in normal working condition.			
V Burnout: voltage analog output lower and higher value for burnout signalation.			

Each channel has independent configurations

INPUT TAG SECTION:

1: first channel tag

2: second channel tag

Each channel has independent configurations.
